

Earth at Night from Space.

This composite photograph shows the tremendous amount of artificial outdoor lighting in use throughout the world. When light is used to illuminate outdoor areas, it not only produces the benefits of increased nighttime visibility, it also affects views of the nighttime sky and may spill onto neighboring properties where it is not wanted. This is known as light trespass. Light trespass is wasted light, and wasted light is not only obtrusive, it is expensive and costs money. Consultants like DMD & Associates Ltd. work hard to design outdoor lighting systems that minimize light trespass and also reduce energy consumption. You can reach DMD on the Web at www.dmdeng.com. Currently, DMD has three offices located in British Columbia, Canada, and Washington State.
